

Town of Greig Comprehensive Planning Survey – Analysis of Data (Lewis County, New York)

Among Property-owners in the Town of Greig –
Reasons for Choosing to Live There; Issues of
Concern in the Town; Opinions About Future
Town Development; and Satisfaction with
Current Services Provided

Prepared on behalf of the
Lewis County Board of Legislature
Lowville, New York
May 2015

Executive Summary of Study Findings

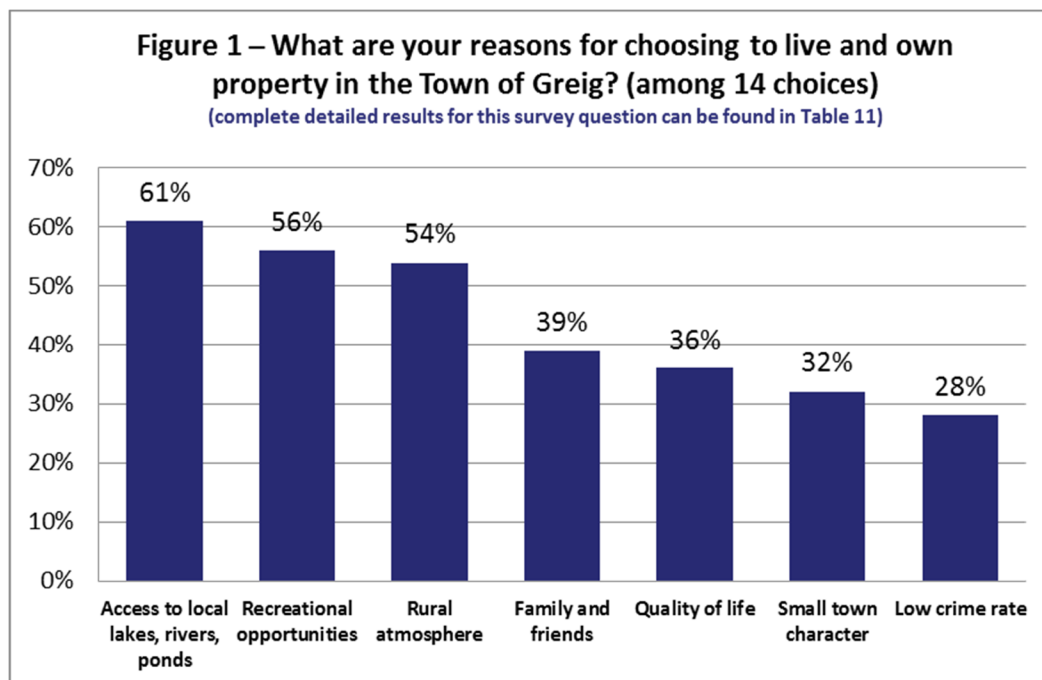

Overview

The following thirteen figures present the overall top-line results for a Comprehensive Planning Survey completed by the Town of Greig Comprehensive Planning Committee. The survey was completed by 620 adult property-owners in the Town of Greig, Lewis County, New York. The survey was distributed by the committee in the summer of 2014. The responses were collected throughout 2014 and in February 2015 the hard-copy surveys were delivered to the *Center for Community Studies* at Jefferson Community College (SUNY), Watertown, New York. The survey data has been compiled, cleansed, and analyzed statistically by the *Center*. The following thirteen figures present the highlighted (often-times, “most-common”) responses for each planning-related survey question included in the study. Please note that at times due to rounding a graph (distribution) the sum of percentages on a graph may not actually sum to exactly 100%, and in the case when responses to a multiple-response question are reported the sum would not be expected to be 100%. More complete analysis of each survey question, including correlational analyses, are included later in Section 2 of this report. The average margin of error for these survey results is $\pm 2.3\%$.

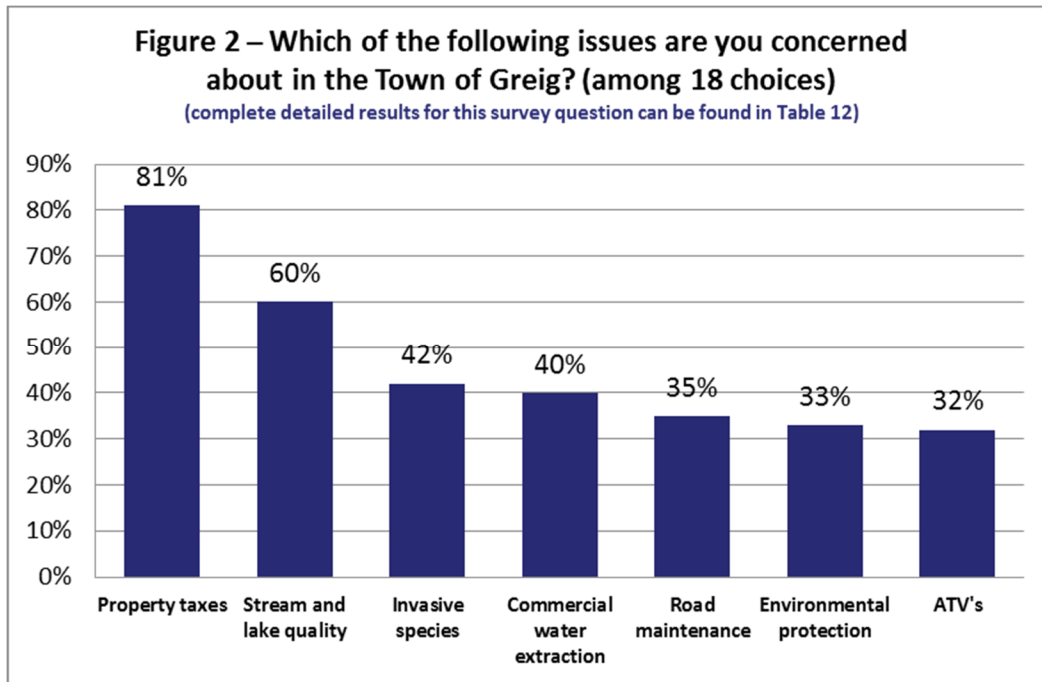

In summary, this comprehensive planning study was organized into the following four sets of research objectives (survey questions):

- ***Reasons for choosing to live and own property in the Town of Greig***
- ***Issues in the Town of Greig that Concern You***
- ***Opinions About Future Development in the Town of Greig***
- ***Services Provided by the Town of Greig***

Section 1

Introduction and Description of the Study

1.1

PURPOSE AND GOALS FOR THIS STUDY

The Town of Greig is located in Lewis County in rural Northern New York. According to the most recent U.S. Census estimates the town includes 511 households with 1,199 permanent residents. A significant feature of the town is the location of Brantingham Lake in the town, with many seasonal residences located on its shores and in the immediate vicinity. Again according to U.S. Census estimates the town includes approximately 700 residences that are seasonal. There are a total of 1,381 unique unduplicated property-owning households in the town, including both properties that have residences (seasonal and/or permanent) and properties that are vacant land.

In 2014 the Town of Greig Comprehensive Planning Committee identified the need to assess opinions from town residents, property-owners, and taxpayers regarding the town's resources, its development, and local land use controls. The committee considered these opinions as crucial in developing a comprehensive and accurate understanding of the feelings that exist in the Town of Greig toward future development. Therefore, the committee designed a survey in an effort to collect the thoughts of residents, property-owners, and taxpayers to help guide growth in the town and protect the character of the community.

The Town of Greig Comprehensive Planning Committee identified the following five **leading reasons** to the Town of Greig's Comprehensive Plan:

1. Establish a contemporary and positive vision.
2. Identify actions to ensure economic stability and protect valuable natural, cultural, and historic resources.
3. Protect and enhance the tax base.
4. Provide Guidance and direction to all governmental and non-governmental interests active in the Town of Greig.
5. Identify the Town's assets and liabilities.

Specifically, in addition to recording selected demographic data from town residents, property-owners, and taxpayers, this comprehensive planning survey that included over 150 variables (survey questions) was organized into the following four sets of research objectives (sets of related survey questions):

- ***Reasons for choosing to live and own property in the Town of Greig***
- ***Issues in the Town of Greig that Concern You***
- ***Opinions About Future Development in the Town of Greig***
- ***Services Provided by the Town of Greig***

The anonymous survey was mailed to property-owners, with only one survey being sent to each individual taxpayer address regardless of whether or not the property was owned by multiple individuals, with a final due or acceptance date for completed surveys established as July 31, 2014. Therefore the population that was defined by the Town of Greig Comprehensive Planning Committee for this research was households that owned property in the town, not necessarily individuals.

The survey was completed by 620 households that own property in the Town of Greig. The responses were collected by the Town of Greig Comprehensive Planning Committee. In December 2014 the Comprehensive Planning Committee contacted the *Center for Community Studies* at Jefferson Community College (SUNY), Watertown, New York to arrange for the compilation and statistical analysis of the resulting survey data. In February 2015 the hard-copy surveys were delivered to the *Center for Community Studies*. Data has been cleansed, compiled electronically, and statistically analyzed and reported. This report is a summary and explanation of the findings of the 2015 Town of Greig Comprehensive Planning Survey.

1.2

METHODOLOGY – HOW THESE DATA WERE COLLECTED

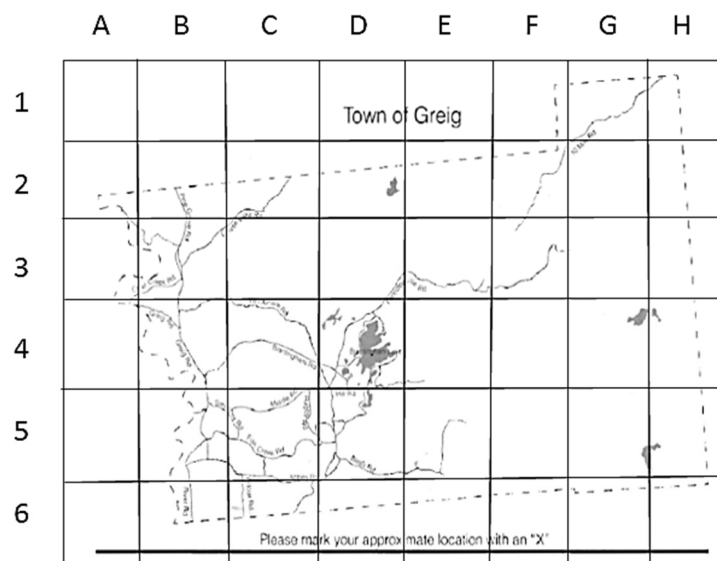

The Survey

The survey instrument used in this study was developed through the collective efforts of the Town of Greig Comprehensive Planning Committee and a graduate student from Syracuse University who assisted. The survey instrument included the following four sections of planning-related survey questions, along with several demographic characteristics of the participants.

- ***Reasons for choosing to live and own property in the Town of Greig***
- ***Issues in the Town of Greig that Concern You***
- ***Opinions About Future Development in the Town of Greig***
- ***Services Provided by the Town of Greig***

The demographic characteristics of participants are described in further detail in Section 2.1 later in this report. A copy of the exact survey instrument that was used is attached as an appendix to this report. One unique aspect of the survey instrument is that as an attempt to identify the geographic location within the town in which a participant owns property a map was attached as the final page of the survey. Participants were asked to place an “X” on the map where their property or properties were located. This map proved to be quite problematic in that only 506 of the 620 participants actually provided that information. Since many of these 506 persons owned multiple properties this resulted with a total of 541 participants who identified property owned in the collection of subsections of the Town of Greig that are further described below.

The following grid was designed by the Town of Greig Comprehensive Planning Committee and each of the 506 participants who provided map information was coded into their appropriate grid, or grids.

To identify where participants own property, the following cross-tabulation illustrates how many participants identified their “first property” in each of the grids. The percentage of the total of 506 who recorded usable information on the map is shown, as well.

First property: - Row Number: * First property: - Column Letter: Crosstabulation

			First property: - Column Letter:								Total
			A	B	C	D	E	F	G	H	
First property: - Row Number:	1	Count	0	0	0	0	0	0	1	1	2
		% of Total	0.0%	0.0%	0.0%	0.0%	0.0%	0.0%	0.2%	0.2%	0.4%
	2	Count	0	7	21	10	2	0	2	0	42
		% of Total	0.0%	1.4%	4.2%	2.0%	0.4%	0.0%	0.4%	0.0%	8.3%
	3	Count	4	40	13	5	10	15	3	0	90
		% of Total	0.8%	7.9%	2.6%	1.0%	2.0%	3.0%	0.6%	0.0%	17.8%
	4	Count	1	22	22	225	4	0	1	0	275
		% of Total	0.2%	4.3%	4.3%	44.5%	0.8%	0.0%	0.2%	0.0%	54.3%
	5	Count	0	15	32	31	4	1	1	2	86
		% of Total	0.0%	3.0%	6.3%	6.1%	0.8%	0.2%	0.2%	0.4%	17.0%
	6	Count	0	4	4	1	1	0	0	1	11
		% of Total	0.0%	0.8%	0.8%	0.2%	0.2%	0.0%	0.0%	0.2%	2.2%
Total		Count	5	88	92	272	21	16	8	4	506
		% of Total	1.0%	17.4%	18.2%	53.8%	4.2%	3.2%	1.6%	0.8%	100.0%

The cross-tabulation below indicates the number of participants who completed the survey who own property (at least one property) in each of the grid cells. In other words, a participant is now counted where each of their multiple properties are located.

Row Number: * Column Letter: Crosstabulation

			Column Letter:								Total
			A	B	C	D	E	F	G	H	
Row Number:	1	Count	0	1	0	0	0	0	0	1	2
		% of Total	0.0%	0.2%	0.0%	0.0%	0.0%	0.0%	0.0%	0.2%	0.4%
	2	Count	0	9	22	10	2	0	0	0	43
		% of Total	0.0%	1.7%	4.1%	1.8%	0.4%	0.0%	0.0%	0.0%	7.9%
	3	Count	4	42	17	5	11	17	1	0	97
		% of Total	0.7%	7.8%	3.1%	0.9%	2.0%	3.1%	0.2%	0.0%	17.9%
	4	Count	1	27	25	226	4	0	1	0	284
		% of Total	0.2%	5.0%	4.6%	41.8%	0.7%	0.0%	0.2%	0.0%	52.5%
	5	Count	0	18	37	38	5	0	1	2	101
		% of Total	0.0%	3.3%	6.8%	7.0%	0.9%	0.0%	0.2%	0.4%	18.7%
	6	Count	0	5	4	3	1	0	0	1	14
		% of Total	0.0%	0.9%	0.7%	0.6%	0.2%	0.0%	0.0%	0.2%	2.6%
Total		Count	5	102	105	282	23	17	3	4	541
		% of Total	0.9%	18.9%	19.4%	52.1%	4.3%	3.1%	0.6%	0.7%	100.0%

The information contained in the two illustrative tables above was then used by the Town of Greig Comprehensive Planning Committee to define three separate geographic subregions in the Town of Greig:

The “Waterfront” Region – Cells C4, C5, D4, and D5 (near Brantingham Lake)

The “Town Center” Region – Cells A3, A4, B3, and B4 (near Town Offices)

The “Rural” Region – All other cells, not in the “Waterfront” or “Town Center”

Again, the demographic characteristics of participants including geographic location of property is described in further detail in Section 2.1 later in this report, however, it is appropriate to note that 313 of the 506 participants (62%) who accurately provided geographic information indicate that they own at least one property in the “Waterfront” region; 71 of the 506 participants (14%) who accurately provided geographic information indicate that they own at least one property in the “Town Center” region; and 136 of the 506 participants (27%) who accurately provided geographic information indicate that they own property in the town, but in neither the “Waterfront” or “Town Center” regions.

The Population of Interest

The population of interest for this survey is adults age 18 or older, who own and/or reside at properties in the Town of Greig. More specifically, this population includes all persons who own property in the town including both property with a residence on it as well as those who own vacant land. The population of interest in this survey is not exclusive to permanent adult residents in the town. Because of the decision of the Town of Greig Comprehensive Planning Committee to restrict participation to one completed survey per taxable property, it is estimated, that the number of households (taxable properties) in this population of interest is 1,381

The Methodology Employed

The anonymous survey was mailed to all current permanent addresses of taxpayers in the Town of Greig in the summer of 2014, thereby representing both seasonal and permanent residents, as well as owners of property in the town that had no residence constructed on the vacant land. Duplicates (owners of multiple properties) were deleted so that each property-owner only received one copy of the survey in the mail. A total of 1,381 surveys were mailed to current taxpayers. Completed surveys were either mailed back to, or dropped off to, the Town Offices. In February 2015 all completed surveys were delivered to the *Center for Community Studies* at Jefferson Community College for compilation and analysis.

The Sample Collected

With 1,381 possible eligible households that own property in the Town of Greig who could have completed the survey, a sample of 620 completed surveys represents a response rate of approximately 45%, which is exceptional when using mailed surveys with no reward system. A brief summary of the demographic characteristics of the collected sample includes (described in much more detail in Section 2.1):

Demographics of participants this study:	# Participants (n)	% of the sample
Residency Status:		
Permanent residents	224	37%
Seasonal residents	370	61%
Neither	12	2%
# Years own property in the town:		
Less than 5 years	89	15%
5-10 years	116	19%
11-20 years	113	19%
More than 20 years	284	47%
Age Group:		
18-54 years of age (only n=12 age 18-34)	157	26%
55-64 years of age	203	33%
65+ years of age	253	41%
Employment Status:		
Full time employed	278	45%
Part time employed	31	5%
Not employed	10	2%
Retired	293	48%
Own "Waterfront" Property?		
Yes	313	62%
No	193	38%
Own Property in the "Town Center"?		
Yes	71	14%
No	435	86%
Own "Rural" Property – neither "Waterfront" or "Town Center"?		
Own "Rural" (neither).	136	27%
Own either WF or TC.	370	73%

Generalizability and Margin of Error

With the assumption of 1,381 possible eligible adult property-owning households in the Town of Greig who could have completed the survey in the population, and a sample of 620 completed surveys, the average margin of error for this survey is approximately $\pm 2.3\%$. Much greater detail regarding the margin of error that should be used when generalizing the results of this sample to the entire population of interest is described in the Technical Comments in Section 1.3

1.3

TECHNICAL COMMENTS TO ASSIST INTERPRETATION OF THE DATA

The results of this study will be disseminated to, and utilized in decision-making by, a very wide array of readers – who, no doubt, have a very wide array of statistical backgrounds. The following comments are provided to give guidance for interpretation of the presented findings so that readers with less-than-current statistical training might maximize the use of the information contained in this 2015 Town of Greig Comprehensive Planning Survey.

Margin of Error – Constructing Confidence Intervals to Estimate for an Entire Population

When data is collected, of course, it is only possible for the researcher to analyze the results of the *sample* data, the data from the group of individuals actually sampled, or in this case, actually interviewed. However, it is typically the goal of the researcher to use this *sample* data to draw a conclusion, or estimate that which they believe is true, for the entire *population* from which the sample was selected. To complete this estimation the standard statistical technique is to construct a **confidence interval** – an interval of values between which one can be 95% certain, or confident, that the true population value will fall. For example, if a researcher interviews $n=500$ randomly selected participants from some population of size $N=100,000$ individuals, and the researcher finds that $x=200$ of the 500 sampled participants indicate that they “agree” with some posed statement (200 out of 500 would be 40%), then the researcher can never be 100% certain that if all 100,000 population members were, in fact, interviewed then the result for this entire population investigation would be that 40% (that would be 40,000 out of the 100,000) would “agree.” In general, one can never guarantee with 100% certainty that a statistic for some random sample will perfectly, exactly, result the same as the population value that describes the entire population (this value is called a “parameter”). Fortunately, considering the types of variables and resulting data that typically are generated in survey research, use of the statistical tools of probability distributions and sampling distributions allows the determination of a very important distance – the distance that one would expect 95% of the samples of size n to fall either above or below the true population value. This distance is commonly referred to as the **margin of error**. Once this distance (margin of error) is measured, there is a 95% probability that the sample result (the result of the $n=500$ sampled participants in the illustration above) will fall within that distance of the true population value. Therefore, to construct the very useful and easily-interpreted statistical estimation tool known as a **confidence interval**, all one must do is calculate the margin of error and add-and-subtract it to-and-from the sample result (statistic) and the outcome is that there is a 95% chance that the resulting interval does, in fact, include the true population value within the interval. **The margin of error for questions that were answered by the entire sample of 620 participants in this study is approximately $\pm 2.3\%$, therefore one may conclude that the statistics reported in the following sections of detailed statistical results fall within $\pm 2.3\%$ of the true value that would be found if all 1,381 households in the population of interest in this study did, in fact, complete and submit the survey.**

To illustrate the above-described concepts of margin of error and confidence intervals, note that in Table 9 it can be observed that 60.5% of the sample of 620 adults who participated in this survey responded to “What are your reasons for choosing to live and own property in the Town of Greig?” with an answer of *access to local lakes, rivers, and ponds*. With this sample result, one could infer with 95% confidence that if all Town of Greig property-owning adults were asked – somewhere between 58.2% and 62.8% of the population of approximately 2,500 adults would respond to “What are your reasons for choosing to live and own property in the Town of Greig?” with an answer of *access to local lakes, rivers, and ponds* (started with the 60.5% that was found in the sample and added-and-subtracted a margin of error of $\pm 2.3\%$). This resulting interval (58.2%–62.8%) is known as a **95% Confidence Interval**. The consumer of this report should use this pattern when attempting to generalize any of these survey findings for survey questions *that were answered by all 620 participants in this study* to the entire adult population of property-owners in the Town of Greig. When attempting to generalize results for survey questions which had smaller sample sizes (the result of either screening questions, or participants refusing to answer certain questions, or investigating smaller demographic subgroups, such as only those who are seasonal residents), the resulting margin of error will be *larger* than ± 2.3 percentage points.

Margin of Error – More Detail for Those Interested in Maximizing Precision and Accuracy of Estimates

The preceding introductory example used a margin of error of $\pm 2.3\%$, as a result of an illustration that used all 620 sampled participants in this study. However, again, the margin of error when using the sample results in this study to construct a confidence interval to estimate a population percentage will not always be $\pm 2.3\%$. There is not one universal value of a margin of error that can be precisely calculated and used for the results for every question included in this survey, or for that matter, any multiple-question survey. Calculation methods used in this study for generating the margin of error depend upon the following four factors, which include three factors in addition to the sample-size factor that has just been addressed:

1. The **sample size** is the number of adults who validly answered the survey question. The sample size will not always be $n=620$ since individuals have a right to omit any question.

Additionally, some survey questions were only posed after screening questions. Further, if one investigates a certain subgroup, such as only those who live in the Brantingham Lake region, obviously the sample size will be smaller than $n=620$. In general, the smaller the sample size then the larger the margin of error, and conversely, the larger the sample size then the smaller the margin of error.

2. The **sample proportion or percentage** is the calculated percentage of the sample who responded with the answer or category of interest (i.e. responded "Satisfied"). This percentage can vary from 0%-100%, and, of course, will change from question to question throughout the survey. In general, the further that a sample percentage varies from 50%, in either direction (approaching either 0% or 100%), the smaller the margin of error, and conversely, the closer that the actual sample percentage is to 50% then the larger the resulting margin of error. As an example, if 160 out of 400 sampled residents "Agree" with some posed statement, then the sample proportion would be $(160 \div 400 = 0.4 = 40\%)$
3. The **confidence level** used in generalizing the results of the sample to the population that the sample represented. In this study, the standard confidence level used in survey research, 95% confidence level, will be used for all survey questions.
4. The **Finite Population Correction Factor (FPCF)** is a factor or multiplier that compensates for the impact that drawing a sample of size n from a population of size N , when N is not all that much greater than n . In other words, the FPCF adjusts for the fact that the closer that one gets to sampling the entire population of interest (in which case $n=N$ would be true), then the closer the sample statistic would be expected to fall relative to the actual population value, which in turn, is reflected in a reduction of the margin of error as n approaches N . In general, the closer that a researcher gets to sampling the entire population of interest then the smaller the margin of error.

In mathematical notation, the margin of error for each sample result for this study would be represented as:

$$ME = 1.96 \cdot \sqrt{\frac{p(100-p)}{n}} \cdot \sqrt{\frac{N-n}{N-1}}$$

Where n =sample size = # valid responses to the survey question

p =sample percentage for the survey question (between 0%-100%)

1.96 = the standard normal score associated with the 95% confidence level

$$FPCF = \sqrt{(N-n)/(N-1)}$$

Since the sample size varies (in fact, could conceivably be different for every question included in the survey) and the sample percentage varies (also, could conceivably be different for every question included in the survey) the following table (Table 1) has been provided for the reader to determine the correct margin of error to use whenever constructing a confidence interval using the sample data presented in this study. This table was generated using the ME formula shown above.

Note that the top portion of Table 1 includes the average margin of error for selected sample sizes that could result for specific investigations of this survey data. It is the bottom (larger) table in Table 1 referencing both the sample size and the sample proportion that provides the margins of error with the greatest degree of precision.

Table 1

Margins of Error for Varying Sample Sizes and Varying Sample Proportions

Sample Size (n=...)	30	50	75	100	125	150	175	200	250	300	350	400	450	500	550	600	620

Illustration of how to use Table 1 to determine the correct margin of error:

To estimate the percentage in the entire population of Town of Greig property-owning adults who indicate that they are aware that the Town of Greig has a website at www.townofgreig.org, one must simply refer to Table 21 to determine the sample size and percentage of this sample who respond with “Yes”. From Table 21 it is found that 57.9% of the sampled participants replied with “Yes”, and the sample size for this specific question in this study is $n=580$. Reference to Table 1 on the preceding page indicates that the appropriate margin of error would be $\pm 2.9\%$. Therefore, we can be 95% confident that if all Town of Greig property-owning adults were to indicate their familiarity the resulting percentage who would indicate “Yes, *familiar*” among this population would be within $\pm 2.9\%$ of the 57.9% found in our sample. The interpretation of this would be that we are 95% confident that among all Town of Greig property-owning adults the percentage who are aware that the Town of Greig has a website at www.townofgreig.org would be somewhere between 55.0% and 60.8%. Note that this margin of error of 2.9 percentage points is *larger* than the earlier-cited overall study approximate margin of error of approximately 2.3 percentage points as a result of there being only 580 adults in this sample and 57.9% being so close to 50%.

One of the most common uses of Table 1 will be to find the appropriate margin of error when investigating some specific subgroup of the 620 participants, such as only analyzing the responses for seasonal residents, or those who are over the age of 65, or those who own waterfront property, as examples. To complete these subgroup investigations one must know the sample sizes within each of these subgroups. The sample sizes for these typically-demographic subgroups are shown below in Table 2.

Table 2 Sample Sizes Within Demographic Subgroups to be Compared

Subgroups within this study sample:	# Participants (n)	% of the sample
Residency Status:		
Permanent residents	224	37%
Seasonal residents	370	61%
Neither	12	2%
# Years own property in the town:		
Less than 5 years	89	15%
5-10 years	116	19%
11-20 years	113	19%
More than 20 years	284	47%
Age Group:		
18-54 years of age	157	26%
55-64 years of age	203	33%
65+ years of age	253	41%
Employment Status:		
Full time employed	278	45%
Part time employed	31	5%
Not employed	10	2%
Retired	293	48%
Own “Waterfront” Property?		
Yes	313	62%
No	193	38%
Own Property in the “Town Center”?		
Yes	71	14%
No	435	86%
Own “Rural” Property – neither “Waterfront” or “Town Center”?		
Own “Rural” (neither).	136	27%
Own either WF or TC.	370	73%

It should be noted that when surveying humans there are other potential sources of error, sources of error in addition to random error (which is the only error encompassed by the margin of error). Response error, nonresponse error, process error, bias in sample selection, bias in question-phrasing, lack of clarity in question-phrasing, and undercoverage are common sources of other-than-random error. Methods that should be employed to minimize these other sources of error are: maximum effort to select the sample randomly, piloting and testing of utilized survey questions, extensive training of all data collectors (interviewers), and application of post-stratification algorithms. The Center for Community Studies had no role in these other research methods best-practices that may or may not have been employed

in this Town of Greig Comprehensive Planning Survey. In conclusion, when using this study data to make estimates to the entire Town of Greig property-owning adult populations, as is the case in standard survey research practices, the margin of error will be the only error measurement cited and interpreted.

Significance Testing – Testing for Statistically Significant Differences

The technical discussion of statistical techniques above has focused on the statistical inference referred to as *estimation* – construction of confidence intervals using the margins of error described in the tables shown on preceding pages. To take full advantage of the data collected in this study, other statistical techniques are of value. **Tests for significantly correlated factors** with measured variables (or, simply put, “significant differences”) are presented as well.

Often times with survey data, a Chi Square Test or Logistic Regression Methods are utilized to determine whether an observed difference is or is not large enough to be a statistically significant difference. An alternative to the use of a these common tests is to answer a question such as: “Is satisfaction with changes in the Town of Greig over the past five years significantly related to *residential status* ... i.e. permanent residents and seasonal residents differ significantly in their satisfaction level?”) will be used throughout this study. Each correlational investigation in this report is presented in its own cross-tabulation table (e.g. an investigation for a relationship between “Age” and “perceived importance of preserving the character of the Town of Greig” is presented in its own table). As a result of over 100 outcome variables in this study – each cross-tabulated by all seven of the potential explanatory variables of Residential Status, Longevity of Owning Property in the Town, Age, Employment Status, and three separate geographic-based variables identifying the region of the town where a participant owns property – there are hundreds of cross-tabulation correlational investigation tables included in the “Detailed Statistical Results” section of this report. This large number of cross-tabulation tables (combined with the variety of ways that the response distribution for many survey questions could be collapsed) suggests that an alternative, more versatile, approach to testing for significance in the cross-tabulation tables is utilized. Therefore, rather than calculating and reporting the results for every cross-tabulation table, the following method is recommended.

When the reader wishes to determine whether or not an observed difference in a cross-tabulation table is statistically significant (e.g. “From Table 19, does the 69.6% of the 158 sampled *permanent residents* in the Town of Greig indicating satisfaction with changes in the Town of Greig over the past five years differ significantly from the 75.1% of the 249 sampled *seasonal residents* who expressed this level of satisfaction?”), the following method is recommended:

“When the confidence intervals of two estimates of the same indicator from different subgroups do not overlap, they may be said to be statistically significantly different, i.e., these differences are unlikely related to chance and are considered true differences. If there is any value that is included in both intervals, the two estimates are not statistically significantly different.”

In other words, the reader may identify the specific response choice of interest ... is one interested in only investigating “Very Important,” or more interested in collapsing the two possible response choices “Very Important” and “Important” together? Then, after observing the sample sizes for each subgroup compared in the cross-tabulation tables, one may again refer to Table 1 in this study to identify the correct margins of error if estimating proportions (or, “percentages” or “rates”) for subgroups. With these two margins of error, two separate confidence intervals may be constructed, and this overlap-vs.-non-overlap rule may be applied to determine whether or not the observed sample difference between demographic subgroups should be considered statistically significant.

To illustrate with the “Residential Status” and “satisfaction with changes in the Town of Greig over the past five years” potential relationship described earlier:

For Permanent Residents:	n=158, and p=69.6% respond <i>Satisfied</i> ; therefore from Table 1 the approximate margin of error is $\pm 5.4\%$. The resulting confidence interval is: $69.6\% \pm 5.4\%$, or (64.2%, 75.0%)
For Seasonal Residents:	n=249, and p=75.1% respond <i>Satisfied</i> ; therefore from Table 1 the approximate margin of error is $\pm 3.9\%$. The resulting confidence interval is: $75.1\% \pm 3.9\%$, or (71.2%, 79.0%)

Since these two confidence intervals do overlap, the difference between permanent and seasonal residents is not considered statistically significant. In other words, satisfaction with changes in the Town of Greig over the past five years is not significantly related to residential status, the 5.5% difference in rates when comparing permanent and seasonal residents (69.6% among permanent, and 75.1% among seasonal) is *small* enough to be *reasonably likely* that it could be due simply to the chance of random sampling with samples of

size 158 and 249, respectively, if the entire populations of permanent and seasonal residents are truly not different in their levels of satisfaction with changes in the Town of Greig over the past five years.

Again, keep in mind the difference between the analyses that include all 620 sampled property-owners versus those that involved questions that were only asked of certain subgroups (e.g. only those who indicate that they do own multiple properties in the town). When interpreting the cross-tabulations completed in this study, partitioning the overall sample of n=620 by levels of some demographic factors such as Employment Status, sample sizes within specific factor/level combinations can become quite small. With these small sample sizes, extremely large sample differences must be found to be considered statistically significant.

Finally, the preceding comments regarding statistically significant differences between subgroups, and statistically significant changes between study years, are comments addressing **statistical significance** ... which, of course, is not one-and-the-same as **practical significance**. The reader should be reminded that statistical significance addresses the concept of probability, as follows – “is this difference likely to occur in a sample of size n=620 if there is no difference in the entire sampled populations... could the result simply be due to chance?” However, practical significance is an interpretation that is left to the subject area expert, since practical significance addresses the concept of usefulness, as follows – “is this result useful in the real world?” A difference identified in a sample may be statistically significant without being practically significant, however, a difference identified in a sample may *not* be practically significant without being statistically significant.

Please do not hesitate to direct any questions regarding margin of error, confidence intervals, other sources of sampling error, tests of statistical significance, and practical significance to the professional staff at the *Center for Community Studies*.

Section 2

Detailed Statistical Results

This section of the final report of study findings provides a detailed presentation of the results for each of the questions in the survey. There are five separate sections of presentation of detailed statistical results to follow (2.1-2.5). Each section is comprised of an analysis of a set of related survey questions. The survey questions included in this study and analyzed in this report have been organized into the following sections:

1. **Demographic Profile of Town of Greig Study Participants** (Tables 3-10)
2. **What are your reasons for choosing to live and own property in the Town of Greig?** (Table 11)
3. **Issues in the Town of Greig that Concern You** (Table 12)
4. **Opinions About Future Development in the Town of Greig** (Tables 13-19)
5. **Services Provided by the Town of Greig** (Tables 20-24)

The most detailed statistical results are presented within the next five sections of this report on an *individual-question* basis. Whenever possible, the results for *each* of the individual survey questions are presented in this section of the report with the following organizational structure, each typically organized including the following two reporting components, as its own one page (or, at times two pages) of this report:

- (1) The overall collective results for all ≈620 participants combined are presented in a table for each survey question that was included in this study – including sample percentages, sample frequencies or counts when possible, and the sample sizes. The benefit of this table is to provide overall town-level prevalence estimate data.
- (2) Further, the results for each of the survey questions are cross-tabulated by each of the demographic factors of Residence Status (Seasonal vs. Permanent), Longevity of Owning Property in the Town, Age of Participant, Education Level, and Location of Property in the Town of Greig (Waterfront vs. Town Center vs. Neither of these) (this report includes several hundred cross-tabulation tables of results). The results for these correlational investigations are provided in tables along with the “current overall town-wide” tables for each survey item. Readers are reminded that the method to determine which observed sample differences between subgroups (e.g. comparing permanent to seasonal residents in the Town of Greig) are *statistically significant* differences is explained in detail in the “Technical Comments” section earlier in this report, Section

1.3. The statistics reported in the correlative tables (the cross-) are percentages within the sampled subgroups. To determine the sample size for each subgroup – to avoid over-interpretation – the reader should refer to the bottom row in each cross-tabulation table when available, and/or refer to Table 2 in the Technical Comments of this report, Section 1.3. Again, findings should be considered with sample sizes in mind. Statistical tests of significance take into consideration these varying sample sizes.

2.1 DEMOGRAPHIC PROFILE OF TOWN OF GREIG STUDY PARTICIPANTS

Table 3 Residency Status: Permanent versus Seasonal Residence?

Study Results – All Participants:

		Frequency	Percentage
Residency Status	Permanent	224	37.0%
	Seasonal	370	61.1%
	Own non-residential property	12	2.0%
	Totals	606	100.0%

Cross-tabulations: (To identify which observed differences in the tables below are *statistically significant differences*, refer to the description and illustration in the technical comments earlier in this report – Section 1.3)

	Residency Status		How many years have you owned property in the town?			
	Permanent	Seasonal	Less than 5	5-10	11-20	More than 20
Permanent	100.0%	0.0%	21.6%	24.3%	42.3%	44.2%

ISSUES IN THE TOWN OF GREIG THAT CONCERN YOU

Table 12 Which of the following issues are you concerned about in the Town of Greig?

Study Results – All Participants:

	Among All Participants, % who indicated:
Property taxes	80.7%
Stream and lake quality	59.8%
Terrestrial and aquatic invasive species	41.8%
Commercial water extraction	39.5%
Road maintenance	34.9%
Environmental protection	32.5%
ATV's	32.0%
Pollution problems	28.4%
Hunting and fishing	24.8%
Jobs	23.1%
Fire and Police service	20.8%
Snowmobiles	20.2%
Mineral extraction	18.9%
Uncontrolled dogs	18.0%
Minimum lot size	12.1%
Wind turbine development	12.1%
Tourist business	12.0%
Solar energy	7.4%
Other issues	9.8%
None of the above	2.5%

Appendix The Survey Instrument

Town of Greig Comprehensive Planning Survey

The Town of Greig Comprehensive Planning Committee is asking you, as an important member of the Greig community, to give your opinions on our town's resources, its development and local land use controls. Your contribution is crucial in developing a comprehensive and accurate understanding of the feelings that exist in the Town of Greig toward development. This survey is our effort to get your thoughts for guiding growth in our town and protecting the character of its neighborhoods. Return your completed survey in the envelope provided or drop it off at the Town Hall by **July 31, 2014**. Responses to the questions in this survey are confidential and cannot be traced back to you.

Leading reasons to create Greig's Comprehensive Plan are to:

- Establish a contemporary, positive vision
- Identify actions to ensure economic stability and protect valuable natural, cultural, and historic resources.
- Protect and enhance the tax base.
- Provide guidance and direction to all governmental and non-governmental interests active in the Town of Greig.
- Identify the Town's assets and liabilities.

1. What is your residency status? ☐ Permanent resident ☐ Seasonal resident
